

Figure A13. (A) Digital borehole image, (B) slabbed core photograph, (C) thin-section photomicrograph, and (D) whole-core porosity and permeability data for the sandy pelecypod floatstone and rudstone rock-fabric facies of HFC1? for the G-3732 test corehole. Slabbed core sample (B) is from a depth of approximately 40.47 to 40.76 feet below land surface. The thin section photomicrograph (C) is from a depth of 40.6 feet below land surface. The depths have been adjusted downward 1.1 feet to match the digital optical log depth.
